

# MOON CRATERS!

The surface of the Moon is covered in craters! Some are so big you can even see them from Earth! This is your chance to learn how craters are made, but without having to go all the way to space!

## YOU WILL NEED:

A baking tray

Plain Flour

Cocoa Powder

Marbles

## INSTRUCTIONS:

- First, add a thick layer of flour to your baking tray, at least 2cm thick.
- Next, lightly cover the entire surface in a thin layer of cocoa powder.
- Finally, drop your marbles into the tray. Watch as your craters form. The marbles are our comets and asteroids, they move the soil of the Moon (our flour and cocoa) when they crash land!
